

HTML & CSS

Lecture 6

TABLE OF CONTENT

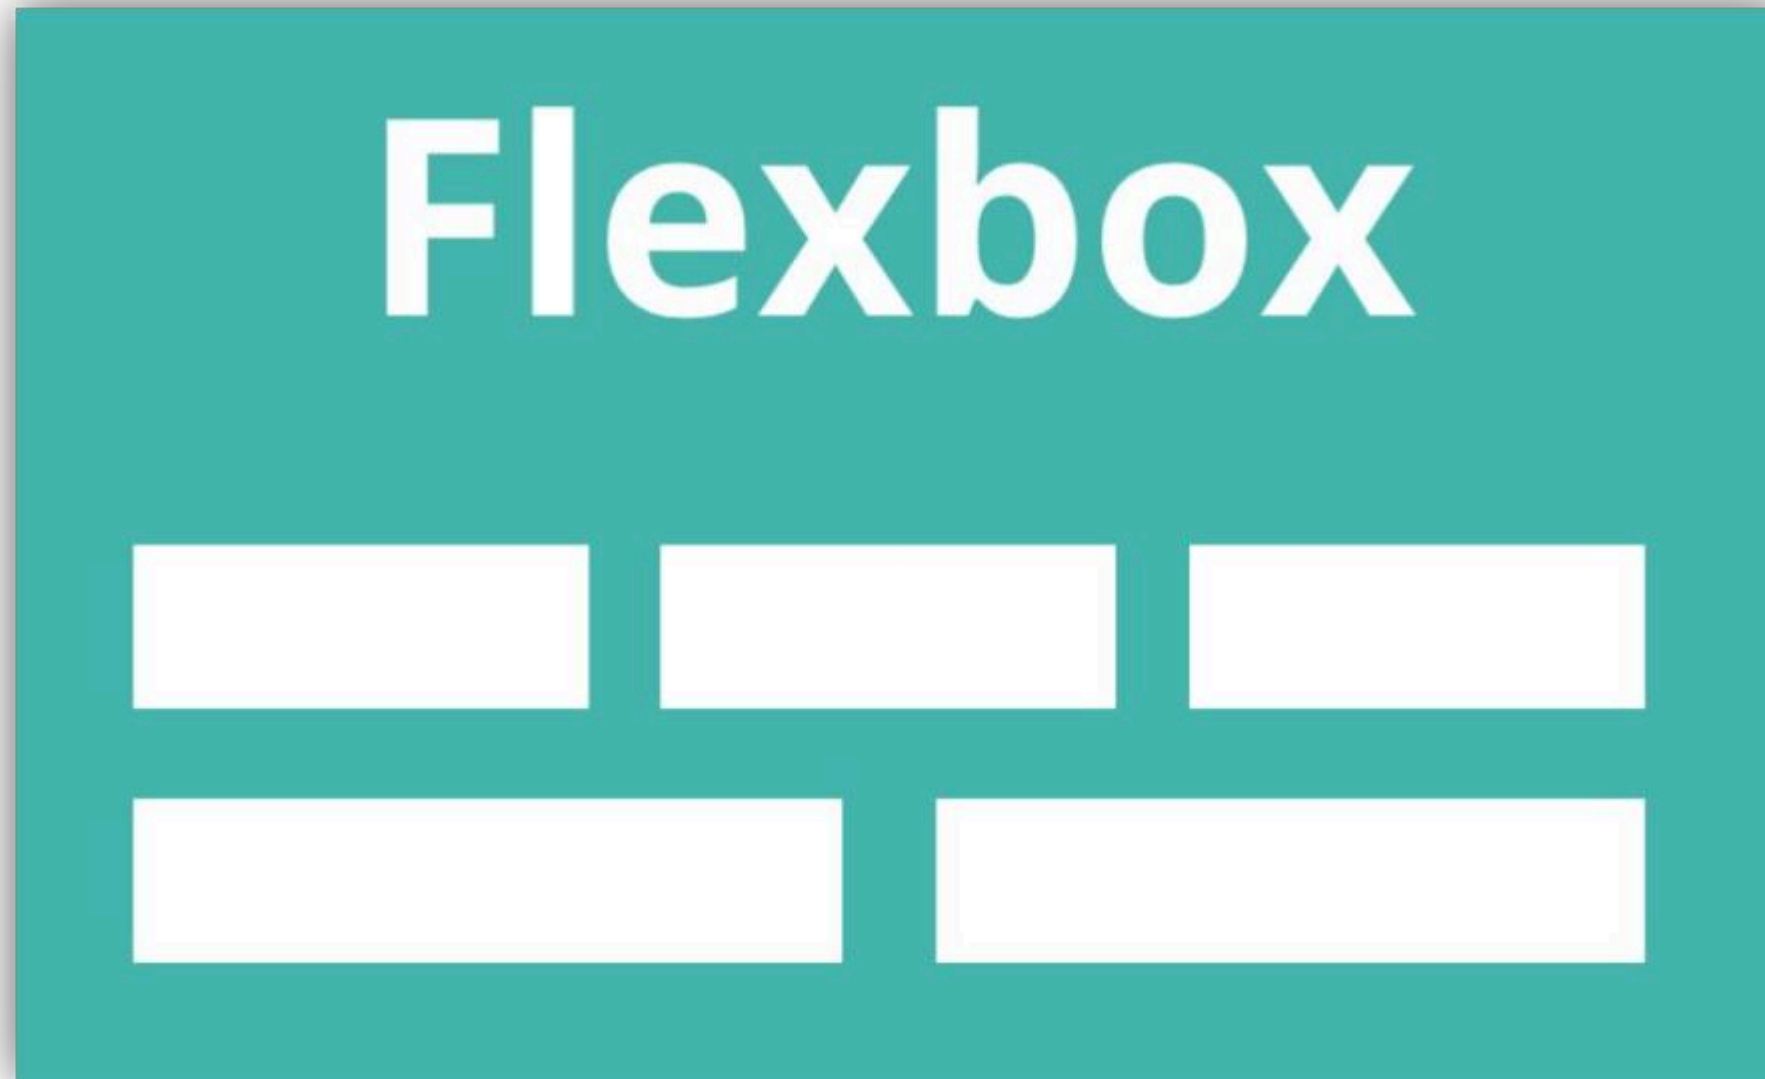

Display Flex

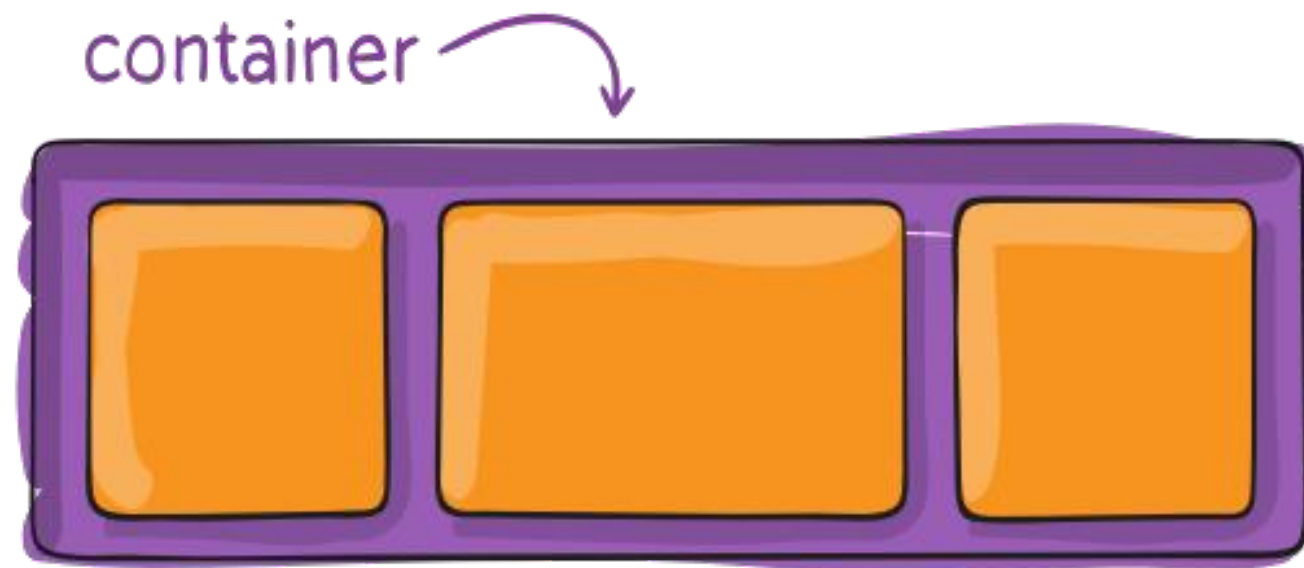

Display Flex property

Display flex

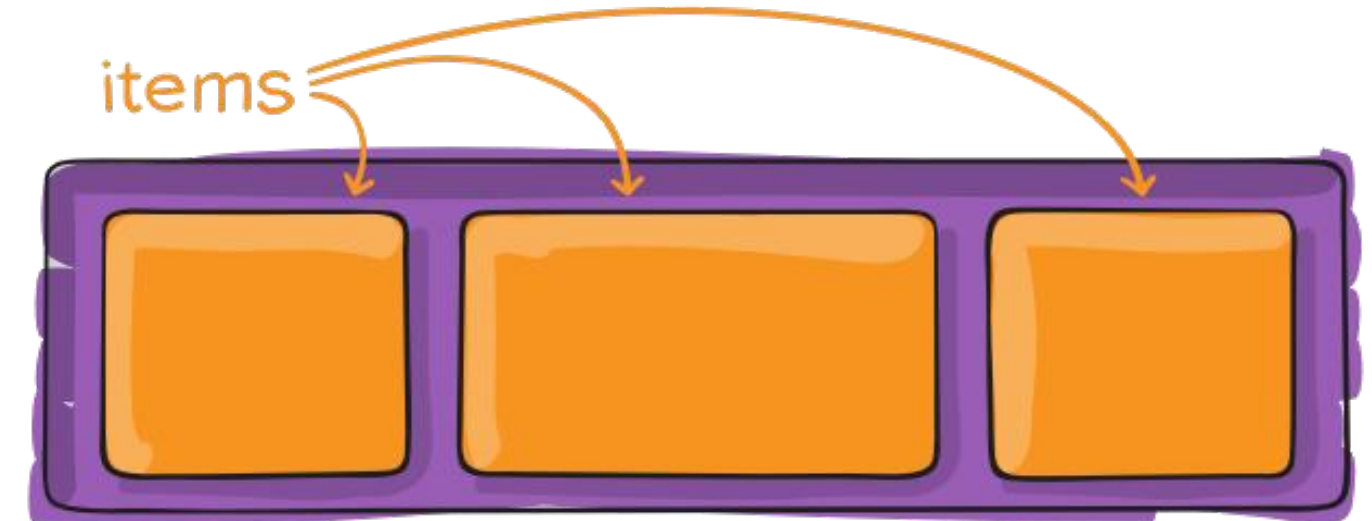

The main idea behind the **flex layout** is to give the container the ability to alter its items' width/height (and order) to best fill the available space

Flex-box properties is divided into flex-container and flex-items

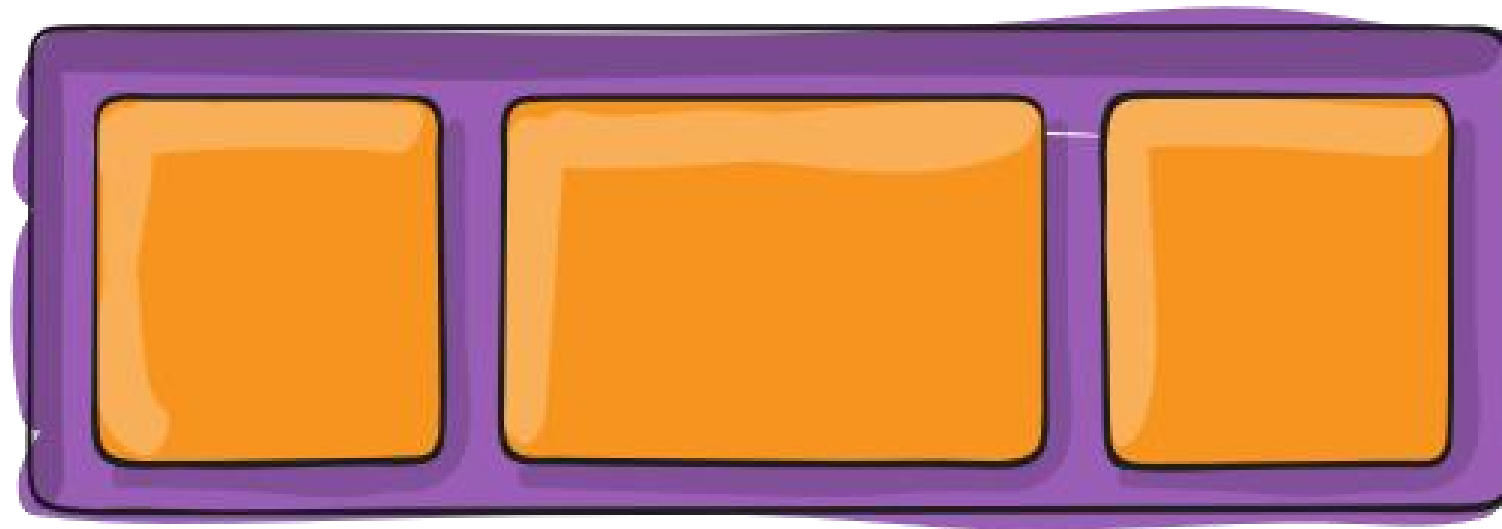

Flex Container

Flex Items

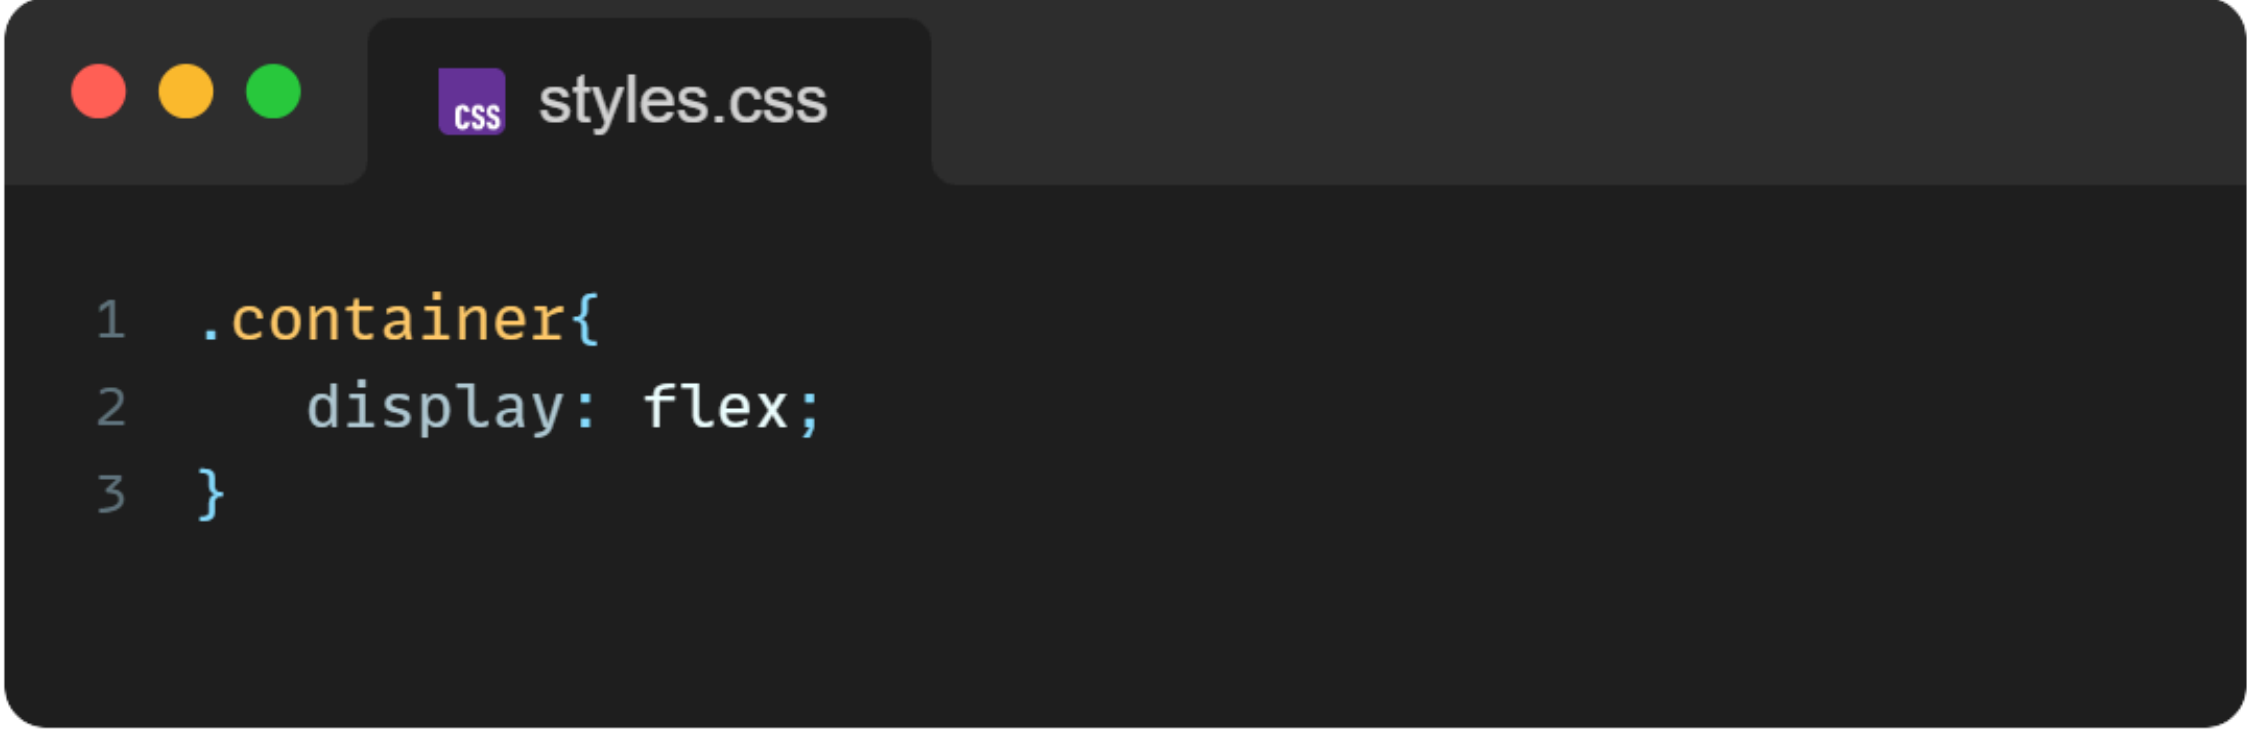

Properties for the Parent (flex container)

container

Flex Container

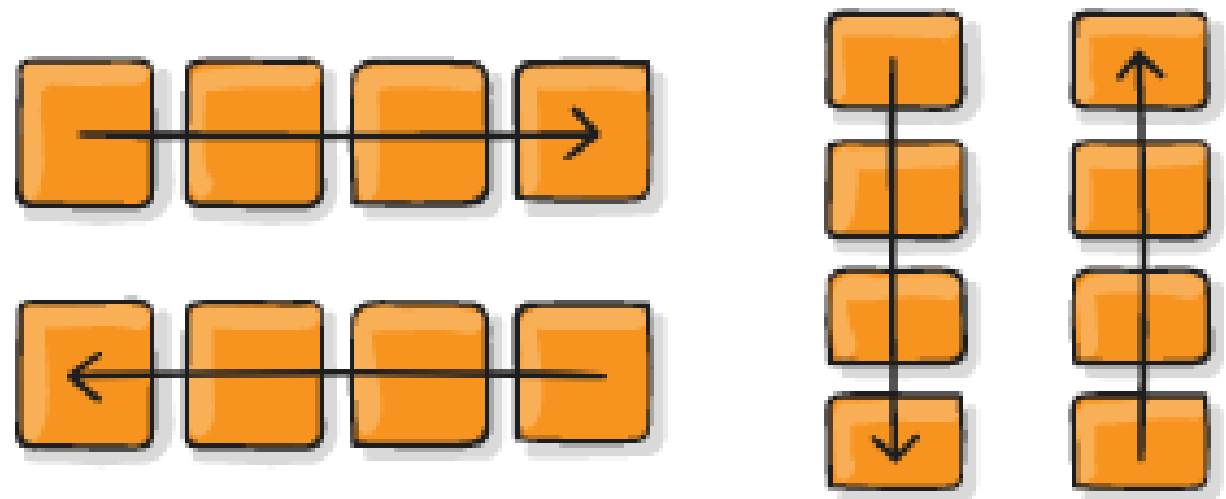

Display

A code editor window with a dark background. The title bar shows three colored circles (red, yellow, green) and a tab labeled 'styles.css' with a 'CSS' icon. The code is as follows:

```
1  .container{  
2      display: flex;  
3  }
```

This defines flex-container, inline or block depend on what we give.
Note that CSS columns

Flex direction

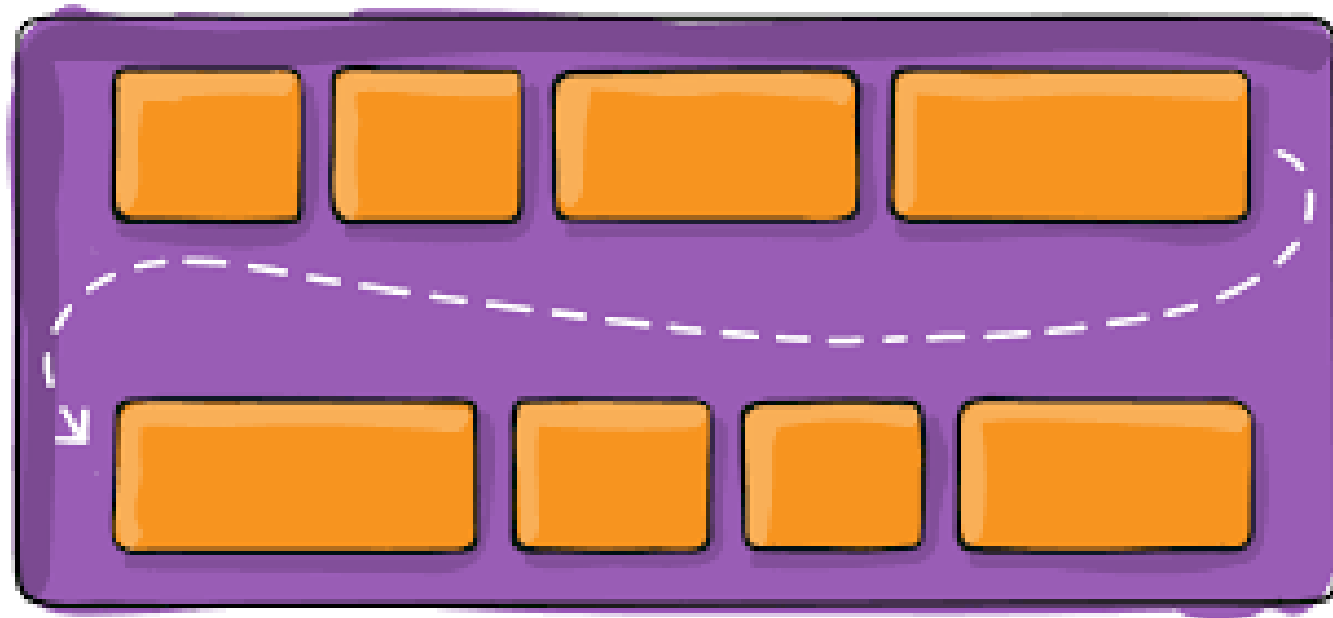

Flex direction defines the direction of an elements

```
css styles.css
1 .container{
2   flex-direction: row | column | row-reverse | column reverse;
3 }
```

- **row(defaule value)** - from left to righy
- **column** - from top to bottom
- **row-reverse** - from right to left
- **column-reverse** - from bottom to top

Flex wrap

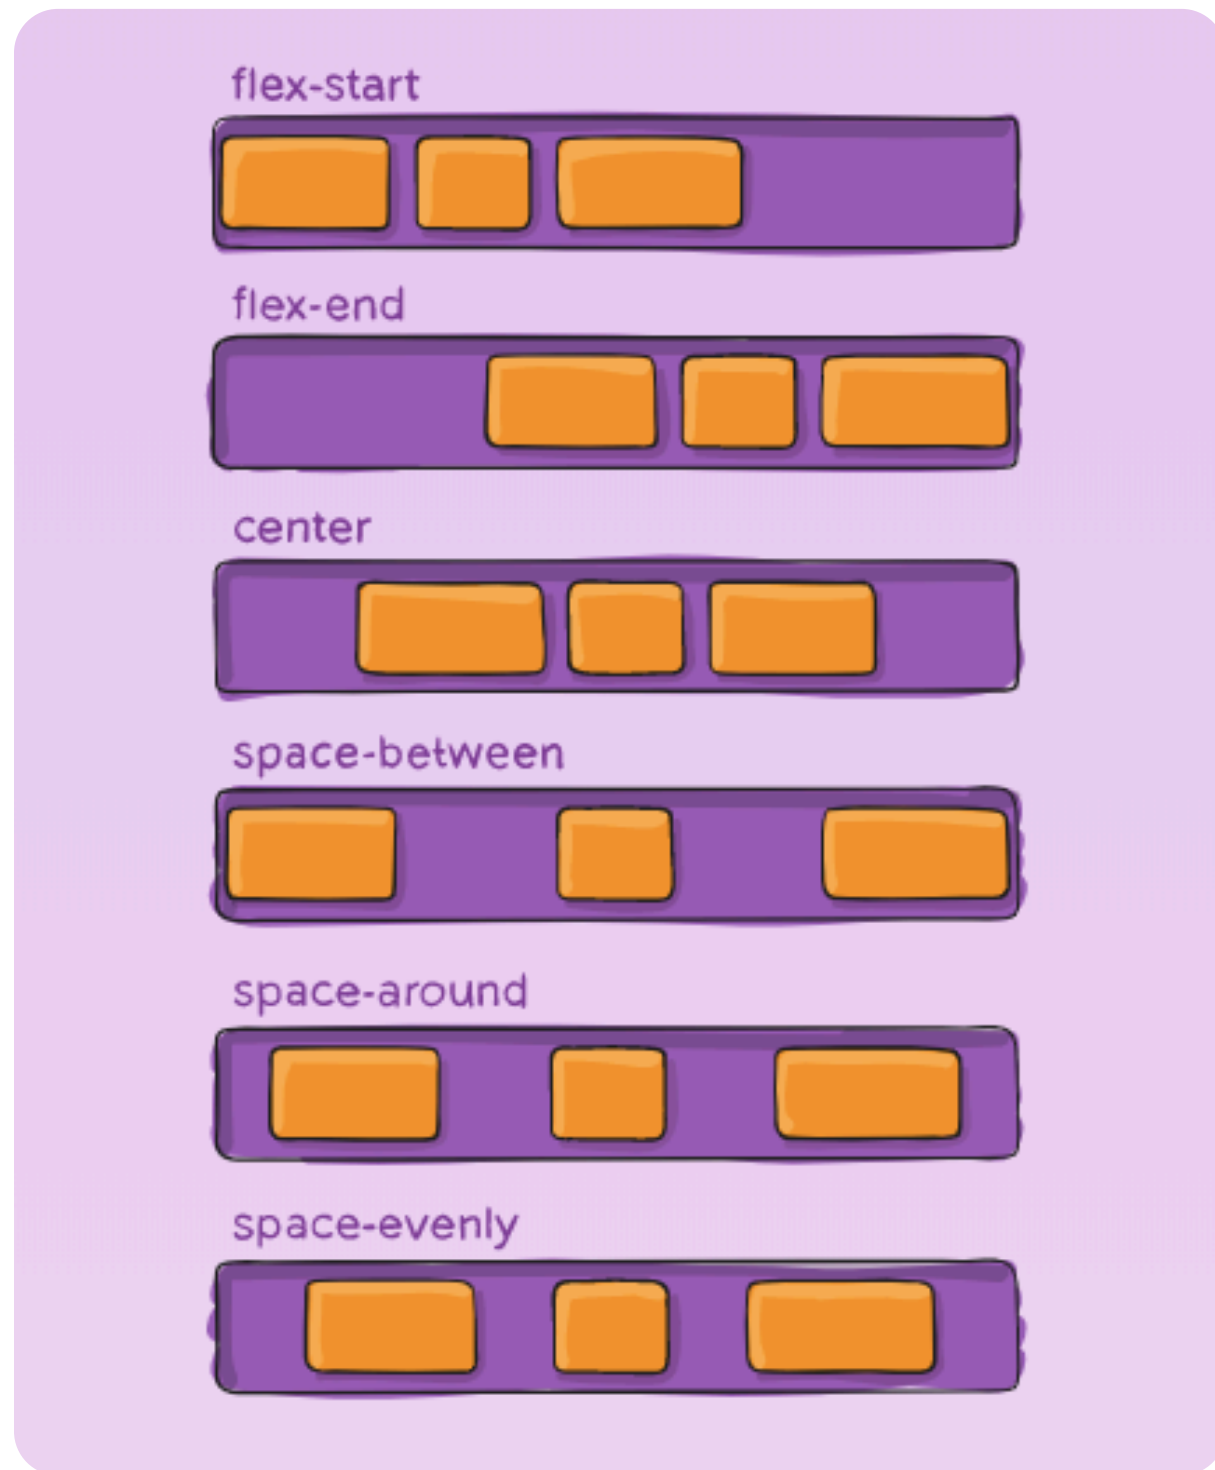

Flex wrap controll elements
when they become more
than plenty

styles.css

```
1 .container{  
2   flex-wrap: nowrap | wrap | wrap-reverse;  
3 }
```

- **nowrap(default value)** - all flex items will be on one line
- **wrap** - items will be onto another line from top to bottom
- **wrap-reverse** - items will be onto another line from bottom to top

Justify content

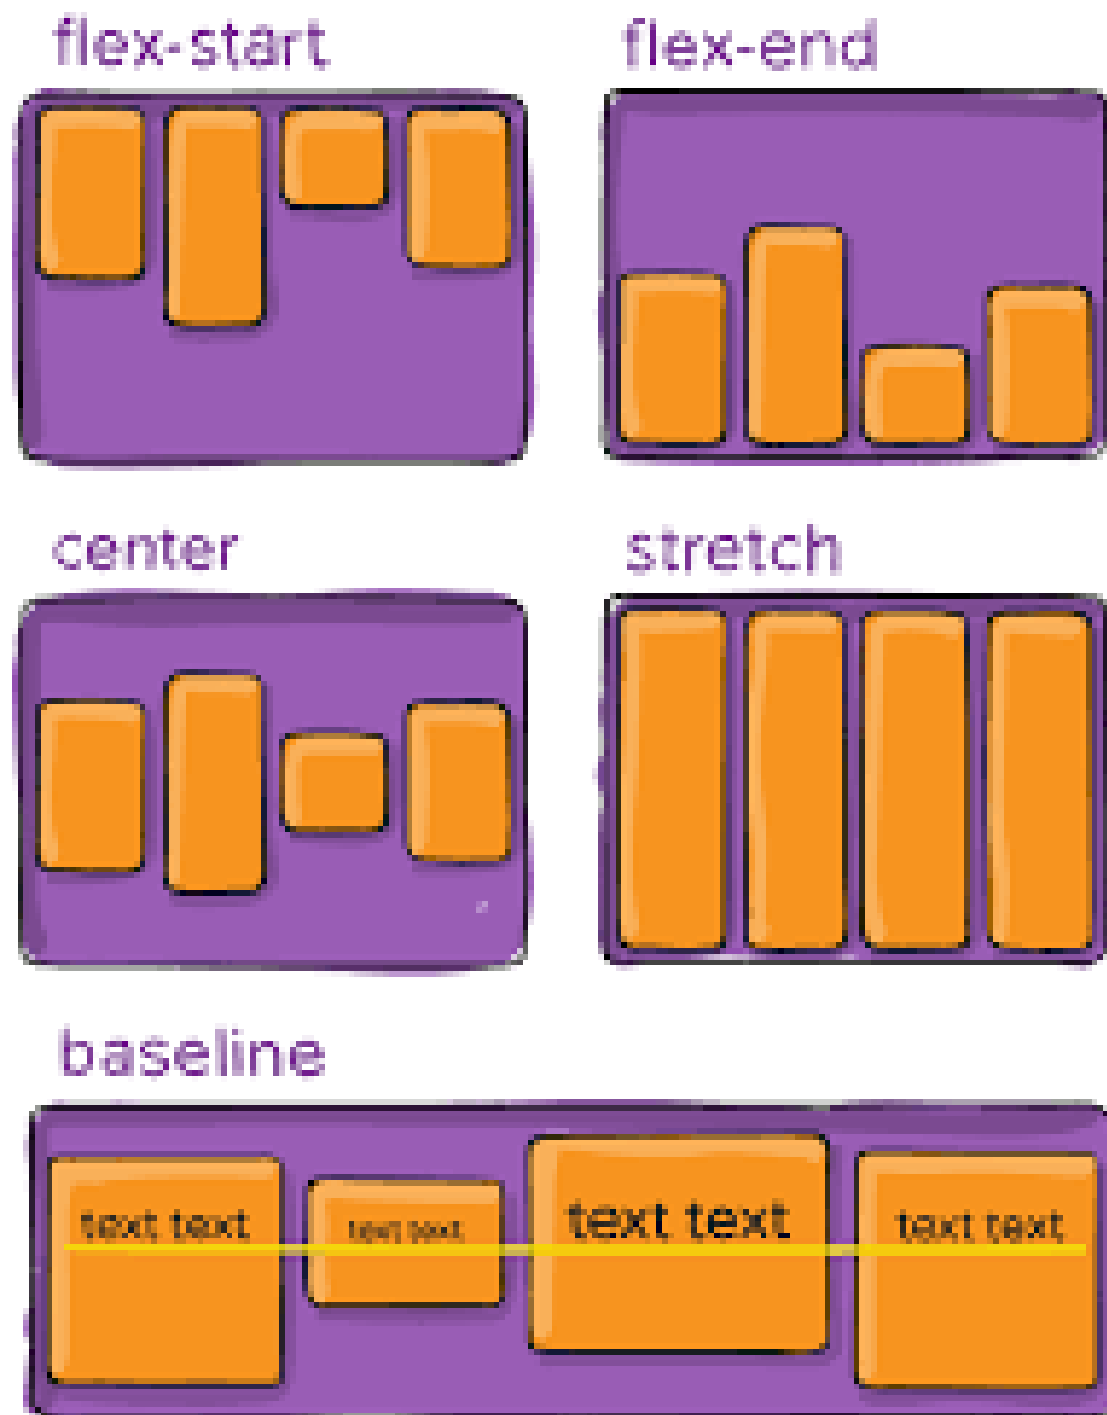

Justify content divide free spaces between elements and control them in one line.

```
styles.css
1 .container{
2   justify-content: start | center | end | space-between |
3     space-around | space-evenly;
4 }
```

- **start(default)** - put elements in the start;
- **center** - put elements in the center
- **end** - put elements in the end
- **space-between** - divide empty place between elements
- **space-around** - more between and less in corners

Align items

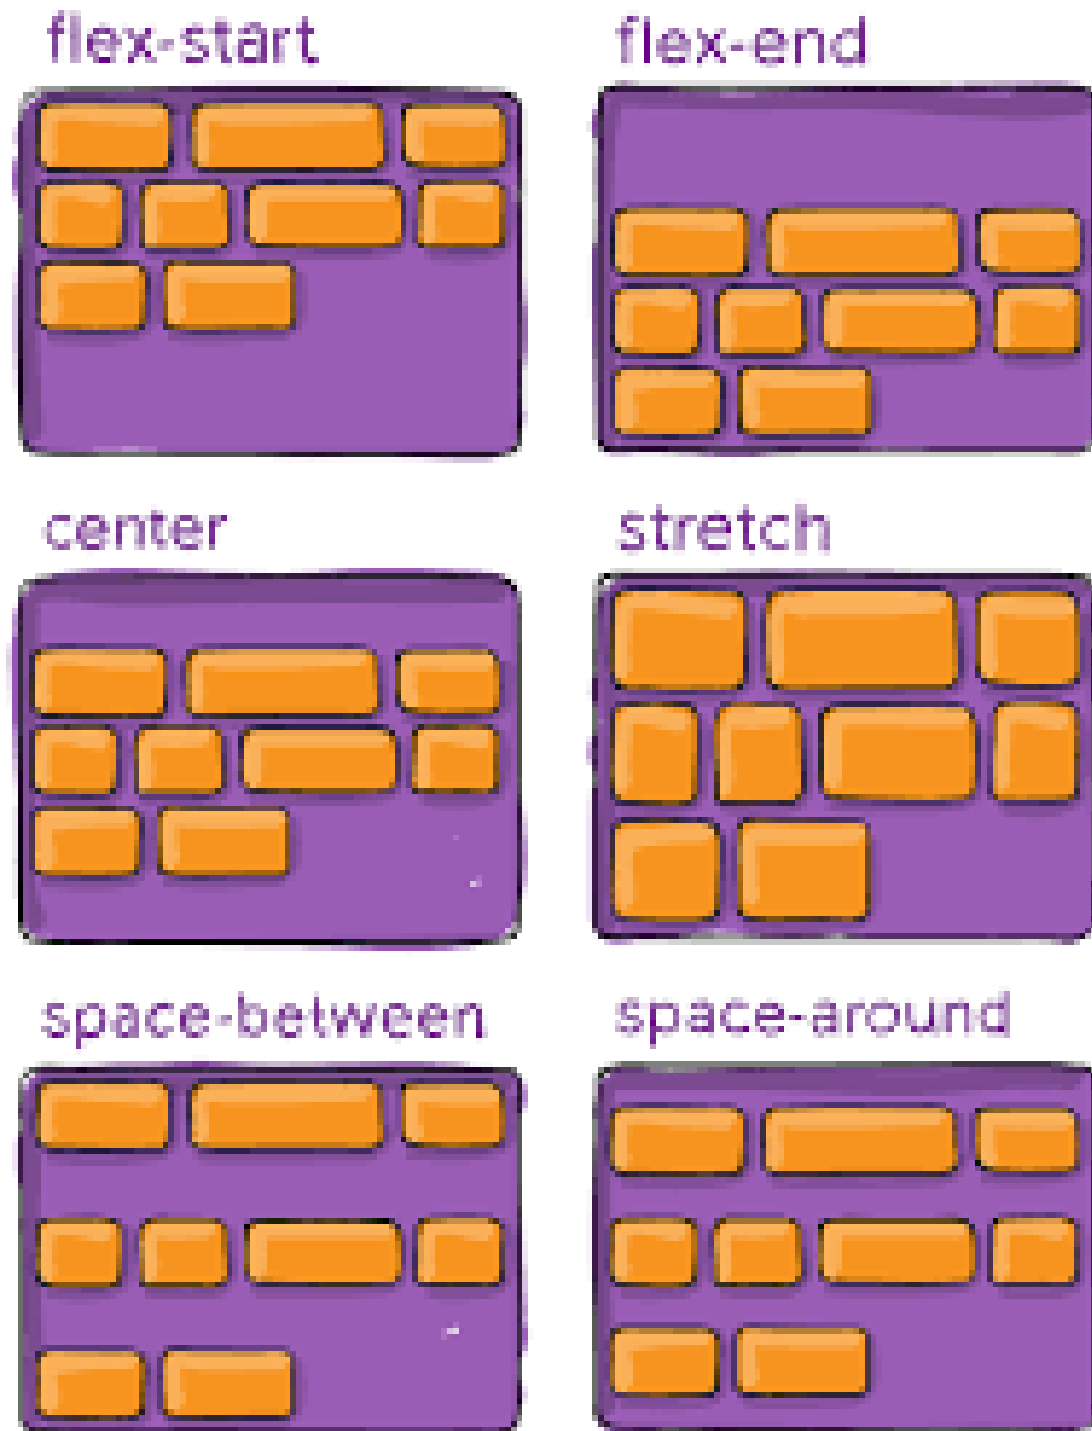

Align items control elements in a column and work with no more than one line.

```
1 .container{
2   align-items: start | center | end | stretch
3               | baseline;
4 }
```

- **stretch(default)** - stretch to fill the container;
- **center** - put elements in the center
- **end** - put elements in the end
- **start** - put elements in the start
- **baseline** - put items in one line depend on their text

Align content

Align content divide free spaces between elements and controll them in a column.

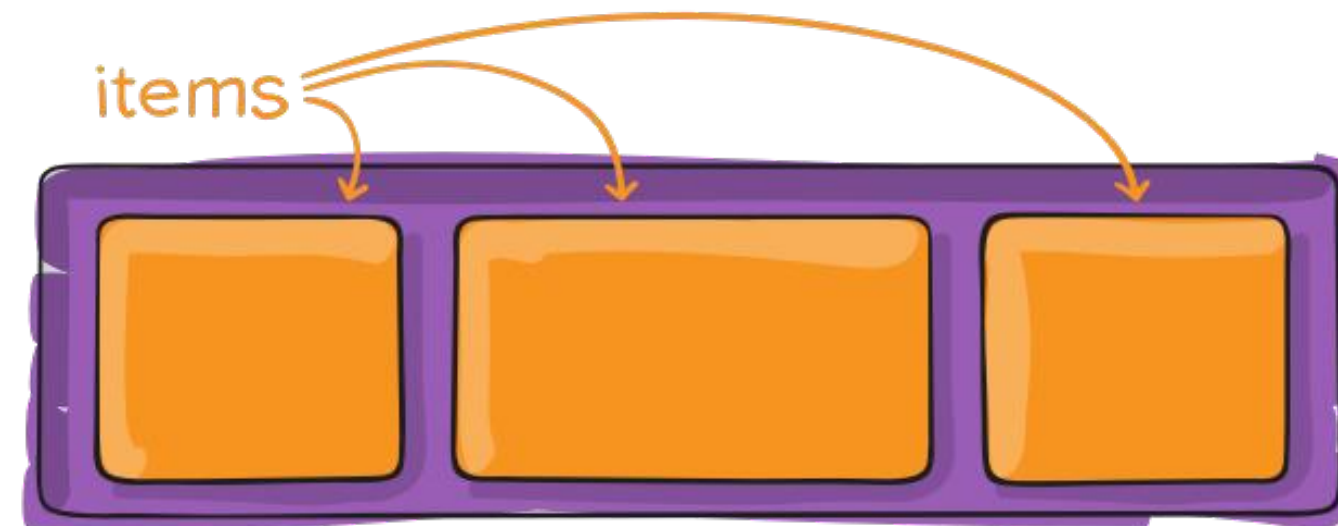

```
css styles.css
1 .container{
2   align-content: start | center | end | stretch
3                 | space-between | space-around;
4 }
```

- **stretch(default)** - stretch to fill the container;
- **center** - put elements in the center
- **end** - put elements in the end
- **start** - put elements in the start
- **space-between** - between element;
- **space-around** - more between element, around

That's it you already know about main HTML properties of (Flex container)

Let's see properties of flex Items

Properties for the children (flex items)

Flex items

Order

Order is flex items property and sort element from small number to bigger

Order can get only number depend on how we want to sort elements

Flex grow

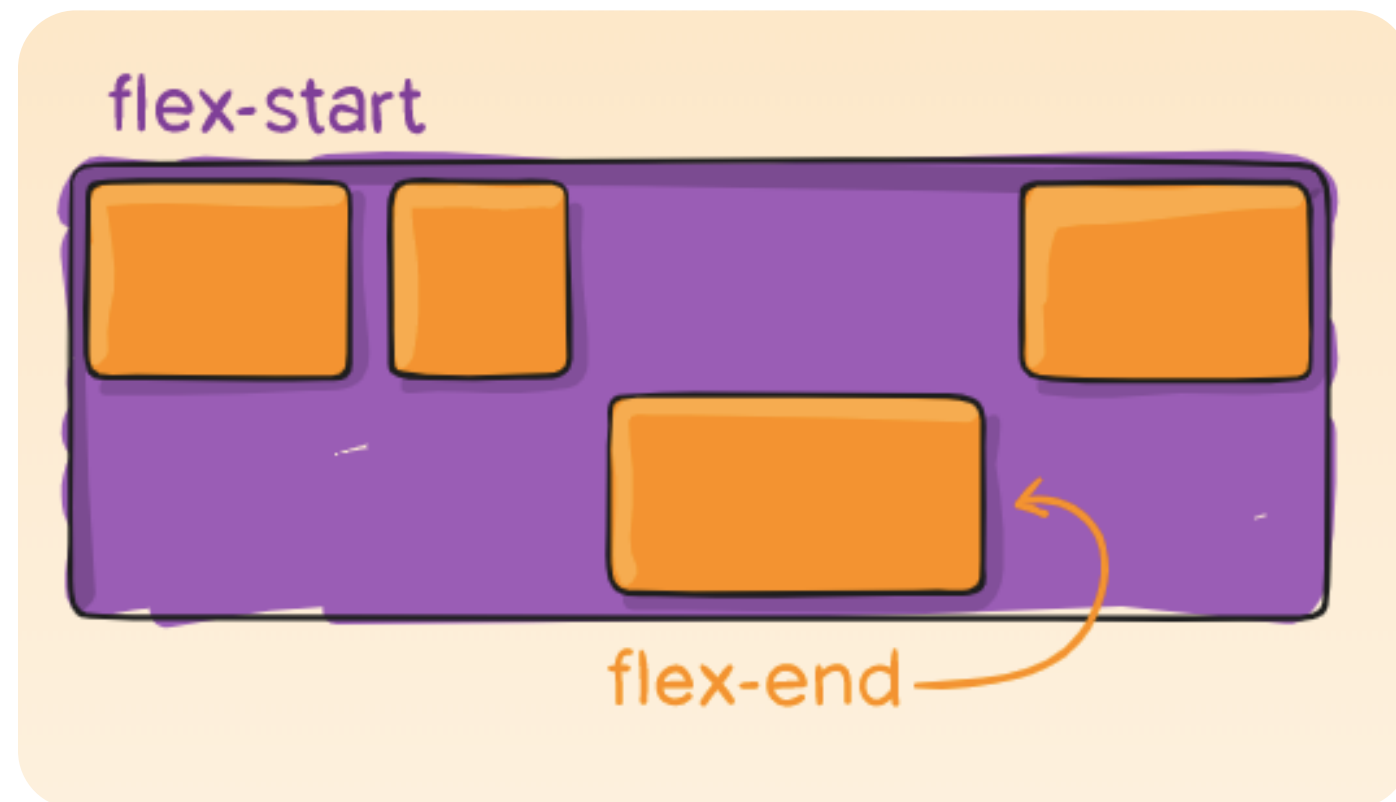

Flex grow is flex items property and give empty place to an element

```
css styles.css

1 .container{
2     flex-grow: 2;
3 }
```

Flex grow can get only number depend on how we can controll element

Align self

```
1 .container{  
2   align-self: auto | start | center | end |  
3               stretch | baseline;  
4 }
```

- **auto** - this is default value;
- **center** - put one element in the center
- **end** - put element in the end
- **start** - put element in the start
- **baseline** - align one element depend on its text
- **stretch** - fill one element in a column

It was main properties of flex items

Now you all know about CSS Flex
box properties

THANK YOU!

“Success is not final; failure is not fatal: It is the courage to continue that counts.”
