What is a branch?

Working with branch

Learning basic commands

What is a branch ?

A branch is like a separate line of work or a "timeline" for your code changes.

Imagine it as a copy of your project where you can make changes without affecting the main project. This is useful when you want to try new features, fix bugs, or make updates without disturbing the main (or main/master) code.

What is a branch ?

Project can have some many **branches** and the “main” or “master ” will be the main **branch** in project

How to create branch

- Command for creating branch and
- Command for creating branch and switch to it immediately

A terminal window with a dark background and a tab labeled 'git_bash'. It contains two lines of code: 'git branch "impl-branch-name"' and 'git checkout -b "impl-branch-name"'.

```
git branch "impl-branch-name"  
git checkout -b "impl-branch-name"
```

A terminal window with a dark background and a tab labeled 'git_bash'. It contains one line of code: 'git push -u origin impl-branch-name'.

```
git push -u origin impl-branch-name
```

After creating your branch and making changes, you can push it to the remote repository

How update repository ?

How update get last chages ?

Imagine you have a box and u need to collect all your items

A terminal window titled 'git_bash' with three colored window control buttons (red, yellow, green) in the top-left corner. The command 'git add .' is entered in the terminal.

With “git add .” you will collect all your changes

A terminal window titled 'git_bash' with three colored window control buttons (red, yellow, green) in the top-left corner. The command 'git commit -m "any"' is entered in the terminal.

With “git commit -m “any” you will name the box of changes ”

A terminal window titled 'git_bash' with three colored window control buttons (red, yellow, green) in the top-left corner. The command 'git push' is entered in the terminal.

When you push changes, they go to the remote repository (origin) on the branch you are currently on

Another commands

```
git_bash

Creates a new Git repository in the current directory.
> git init
Downloads a copy of an existing repository from a remote source
> git clone <repository-url>
Displays the status of your working directory like files
> git status
Shows the commit history for the current branch.
> git log
Merges changes from the specified branch into the current branch.
> git merge <branch-name>
Fetches and merges changes from the specified branch on the
remote repository into your current branch
> git pull origin <branch-name>
....
```

THANK YOU!

Diamonds are born under pressure.
If you can handle this, you will
become a diamond.
